

Some new requirements have come up to install and configure some packages on the Nautilus infrastructure under Stratos Datacenter.

The Nautilus DevOps team installed and configured a new Jenkins server so they wanted to create a Jenkins job to automate this task.

Find below more details and complete the task accordingly:

Click on the Jenkins button on the top bar to access the Jenkins UI. Login using username admin and Adm!n321 password.

Create a Jenkins job named install-packages and configure it to accomplish below given tasks.

Add a string parameter named PACKAGE.

Configure it to install a package on the storage server in Stratos Datacenter provided to the \$PACKAGE parameter.
